

Node Landing Page Verification Checklist

Version 3.2

28 September 2026

This checklist defines the minimum information an EOSC Federation Node Landing Page (NLP) must include once the node moves into production, distinct from the node's dedicated page on the eosc.eu website.

A Node Landing Page (NLP) is the web page corresponding to the URL registered for the node in the EOSC EU Node [Contributors Dashboard registration application](#) (section 1.2, pag.4, form field n.6 named: “Website address”), i.e. the entry point through which EOSC users reach the node's own resources and services. Each point below is intended to be objectively verifiable — checkable by inspection or link-following, without a style judgement — and to confirm that the page serves EOSC end-user researchers rather than an internal or institutional audience. The required information may be presented on a single page or split across interlinked pages, provided each point remains independently checkable.

Required

1. The NLP, and every **Node Exchange resource** it links to, directly or via intermediate pages, must be either publicly accessible without login, or accessible via login through the EOSC AAI.

"Accessible via login through the EOSC AAI" means the page presents a login button or link pointing to the Node's EOSC AAI-compliant access mechanism, integrated and verified under requirement [P.2] of the [Production 1.0 Checklist for EOSC Nodes, v1.4](#).

In addition, the NLP must:

2. Clearly state the Node's scope, intended users and responsible organisation. (It is up to the Node to feature all the organisations involved).
3. Clearly and visibly show the EOSC logo and the official Tripartite-approved name of the Node.
4. Include a link to the Node's own dedicated page on the eosc.eu website — the Node's entry under eosc.eu/building-the-eosc-federation, not the eosc.eu homepage or the index page itself.
5. For all **Node Exchange research resources** offered by the Node to EOSC users, the following information must be accessible in English **both on the NLP presenting the resource to the users (directly on the NLP itself or via intermediate web pages linked by the NLP) and via the link to the resource's entry in the EOSC Catalogue:**
 - a. Purpose description;

- b. Acceptable Use Policy (AUP);
- c. User Access Policy (UAP).

To ensure that this information is available via the link to the resource entry in the EOSC Catalogue implies that **the above information** (purpose of the resource, links to both the AUP and UAP documents for the resource) **must be provided in the Metadata about the Resource in the Service or Research Products Metadata catalogues.**

Therefore a), b) and c) must be present, for each resource in the EOSC Exchange, both on the NLP itself (or on pages linked by the NLP web page) and in the Metadata about the Resource in the Node Catalogue.

Note that AUP/UAP can be provided via specific product licenses in the case of datasets, archives, software, i.e. non-Services resources.

AUP and UAP can be provided through the same, single document.

AUP and UAP do not necessarily need to be unique per service (e.g. one AUP and one UAP could apply to all node services and resources)

- 6. Provide means of contacting the Node helpdesk.
- 7. The NLP itself is in English. Other pages need not be, except for the information required by item 5.
